

Chapter 2

Introduction to Quantum Mechanics

1 Linear Algebra

We consider vectors $|\psi\rangle \in V = \mathbb{C}^n$.

1.1 Bases and linear independence

- A *spanning set* for V is a set of vectors $\{|v_1\rangle, \dots, |v_n\rangle\}$ such that $|v\rangle = \sum_i a_i |v_i\rangle$ for any $|v\rangle \in V$.

V may have many different spanning sets. E.g., for \mathbb{C}^2

$$|v_1\rangle \equiv \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \quad |v_2\rangle \equiv \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

and

$$|v_1\rangle \equiv \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 1 \end{pmatrix}, \quad \frac{1}{\sqrt{2}} |v_2\rangle \equiv \begin{pmatrix} 1 \\ -1 \end{pmatrix}$$

are both spanning sets.

- A set of non-zero vectors $\{|v_1\rangle, \dots, |v_n\rangle\}$ are *linearly independent* if

$$\sum_i a_i |v_i\rangle = 0 \implies a_i = 0 \quad \forall i$$

- A *basis* for V is a linearly independent spanning set.
- A basis always exists and any two bases for V have the same number of elements. The number of elements in any basis for V is called the *dimension* of V . We will primarily be interested in finite-dimensional vector spaces.

1.2 Linear operators and matrices

- A *linear operator* is defined by

$$A : V \rightarrow W$$
$$A\left(\sum_i a_i |v_i\rangle\right) = \sum_i a_i A|v_i\rangle$$

It is clear that once the action of A on a basis is specified, the action of A is completely determined on all vectors.

- If $A : V \rightarrow W$ and $B : W \rightarrow X$, then the *composition* of B with A is defined by

$$\begin{aligned} BA : V &\rightarrow X \\ (BA)|v\rangle &= B(A|v\rangle) \end{aligned}$$

- We can view a linear operator as a matrix $A : V \rightarrow W$ by choosing a basis for both V and W . This is called the *matrix representation* of V . Let $|v_i\rangle$ be a basis for V and $|w_i\rangle$ be a basis for W . Then the matrix elements A_{ij} are given by

$$A|v_i\rangle = \sum_j A_{ij}|w_j\rangle$$
